---

In today's high-tech products, software plays an increasingly critical role. It enables lower costs, higher flexibility and more functionality, advanced automation and efficient problem solving. Actually, without it the world you are living in would not be.

Writing code is a broad concept; it goes from shell scripting and designing a web portal, to launching of a rocket and solving open problems in physics. Software is good if it meets or exceeds the functional specifications and contains no bugs. Thus in practice most software is not good. The more complex the problem at hand is, the more complex the software solution becomes, and the more likely it is there will be unmet specifications and tricky bugs.

With a sound software development process and best-in-class software engineers, the quality of the software can approach an acceptable goodness level in much shorter time. That's why we demand every software engineer in our team to be top notch; combining invaluable best practices with expert knowledge and a bright mind.

The result is that our customer products will be better, lower cost and in time.
